Online Boot Store Management System

"Library Management System" is an application, which used for managing the books. In this project, simple features are included like adding books, editing books information, remove and search books and view all books.

The current system is manually entering the book information in the ledger type of book, which involves manual errors. Therefore, you have to develop a system, which is easily maintainable and configurable

Based on their requirements you can decide to build the application, which can provide a highly configurable application.

Functionalities

- 1. Add new Books
- 2. Find Books
- 3. Edit Books
- 4. Remove Books
